

How Can Your Practice Save Time, Money, and Patient Lives?

If you're only managing patient data digitally, you may be losing money! As a healthcare provider, you also produce business records that should be digitized so that you can automate processes and make better use of your electronic health record (EHR) system. You'll streamline your efficiency, improve secure control of sensitive information, and save money.

EHR

Intelligent information management systems enhance traditional EHR (Electronic Health Records) practices by:

1 Handling all kinds of records and documents, not just medical.

2 Helping enable workflow and business process automation.

3 Improving patient care by capturing every detail and document.

4 Increasing security of patient records in compliance with industry regulations.

5 Serving as a scalable system that can grow as the data you manage increases

" Data is rapidly becoming the **currency** of healthcare, and organizations are recognizing the critical nature of **investing in technology** to curate and make data available across their enterprise in a **consistent** and **well-managed** fashion. "

- Cynthia Burghard, Research Director,
IDC's Value-Based Healthcare
IT Transformation Strategies.
